LAB 7: FUZZ TESTING

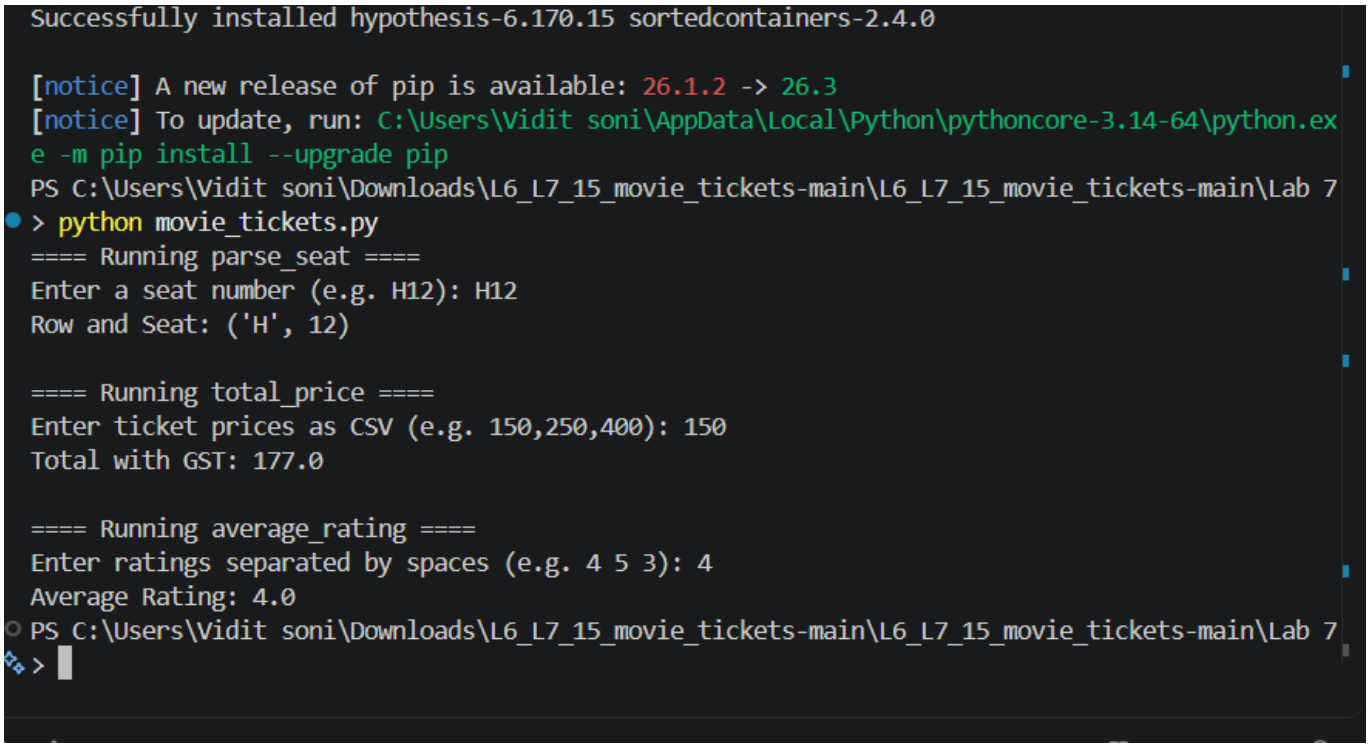

Movie Tickets – Hypothesis-based input validation testing

Student: Vidit Soni
Repository: L6_L7_15_movie_tickets
Test file: test_movie_tickets.py
Application: movie_tickets.py

This document contains the execution screenshots collected during Lab 7: the original application run, failures discovered by Hypothesis, and the final successful test run after fixing input validation.

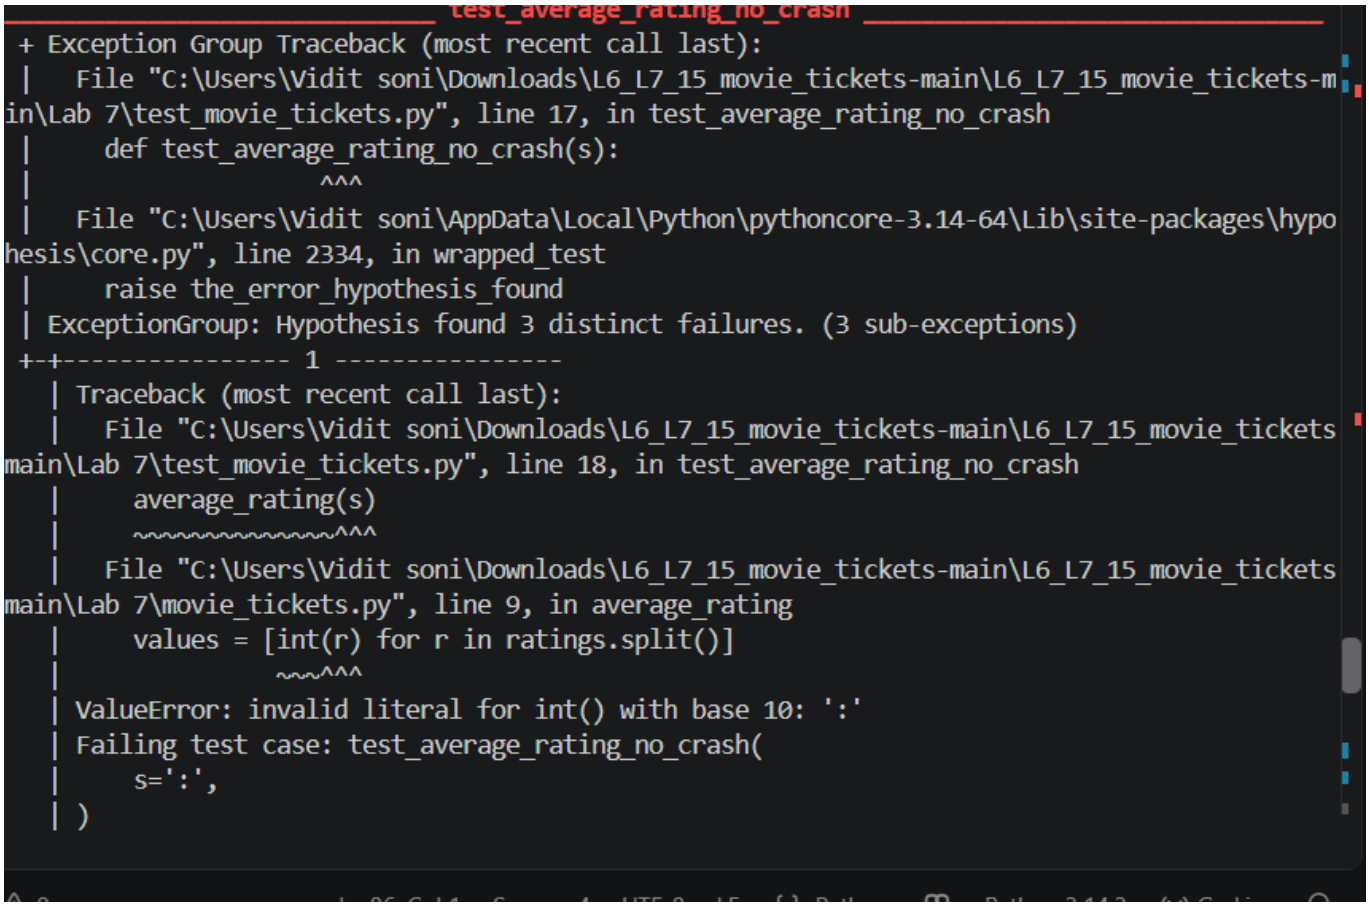

1. Original application execution

The original movie ticket application was run with sample inputs before fuzz testing.

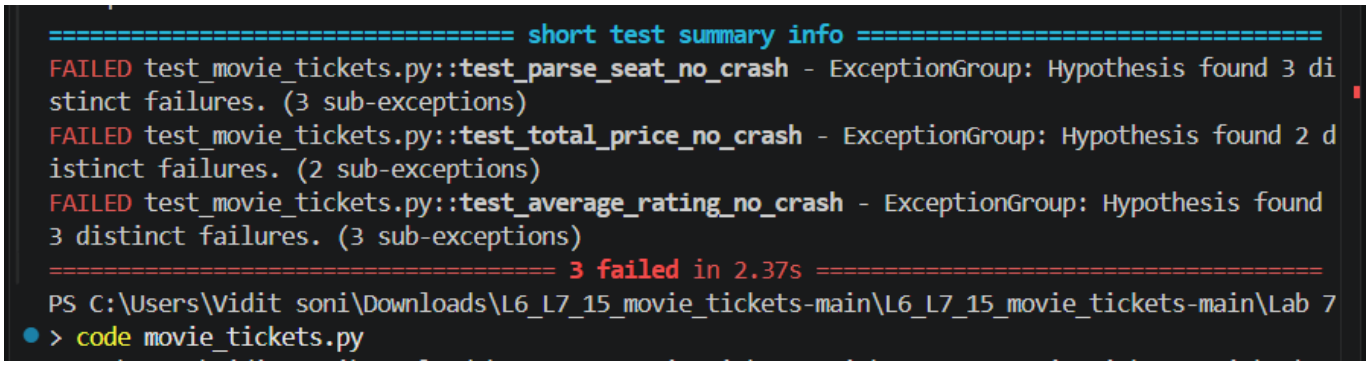

2. Detailed Hypothesis failures

Hypothesis exposed invalid-input failures in parse_seat(), total_price(), and average_rating().

3. Failing test summary

The test summary confirms that all three fuzz tests failed before the application was fixed.

4. Final execution and passing tests

After updating the application, the three Hypothesis tests passed successfully.
